**DECLARATION OF DR. KARL SCHERMANZ UNDER 37 C.F.R. & 1.132**

Mail Stop AMENDMENT  
Commissioner for Patents  
P.O. Box 1450  
Alexandria, VA 22313-1450

Dear Sir:

I hereby declare as follows:

1. I am personally knowledgeable of the facts stated herein.
2. I am an inventor of U.S. Patent Application Serial No. 10/595,795 ("Subject Application"), and thereby have a personal interest in the Subject Application.
3. I have significant experience in the art of NO<sub>x</sub> catalysts and method of preparation as applied in the Subject Application which is currently under examination. (see Appendix A: Curriculum Vitae of Dr. Karl Schermanz).

4. I have read and agree with the information found in the Evidentiary Appendix B executed by Prof. Alessandro Trovarelli, provided herewith.

5. I have reviewed and understand the Subject Application and the Inoue and Wu references.

6. I have reviewed the response to the Office Action being filed herewith, and attest that the claimed process for preparing a NO<sub>x</sub> catalyst resulted in surprising and unexpected results in that use REVanadates in preparing a NO<sub>x</sub> catalyst can provide temperature stability and the ability to retain a high catalytic activity even after being aged at a temperature of as high as 750°C. Previously, all vanadium based catalysts of the prior art are based on V<sub>2</sub>O<sub>5</sub> oxides as the active component. That means that these catalysts begin to sinter from 650°C on and are melting at 690°C, due to their melting behaviour. Accordingly, a deactivation of the catalyst occurs (See Jan MT et al., Chemical Engineering & Technology, Vol. 30, Nr. 10, 1440-1444, 2007).

7. I attest asserts that claims 21 and 22 are patentable over the art of record and these claims will be granted by the EPO in the corresponding EP application number EP20040797861.

8. I attest that the presently claimed invention is a process that surprisingly and unexpectedly can use REVanadates in preparing a NO<sub>x</sub> catalyst with temperature stability and the ability to retain a high catalytic activity even after being aged at a temperature of as high as 750°C. The prior art used a mixture of RE and vanadium oxides to prepare catalysts that sintered and melted at temperatures lower than 750°C, which results in lowered catalytic activity. Thus, the use of REVanadates instead of a mixture of RE and vanadium oxides provides the surprising and unexpected results of temperature stability and retention of high catalytic activity even after exposure to temperatures as high as 750°C, and the claimed process and resulting NO<sub>x</sub> catalyst should be considered to be novel and inventive because the catalysts described in Inoue cannot exhibit the thermal stability of the claimed catalysts because of the low sintering and melting temperature of V<sub>2</sub>O<sub>5</sub>.

9. I attest that Comparative Example 1 of Appendix C herein demonstrates that even very low concentrations of rare earth vanadate present as a dopant do show the catalytic effect. The

concentrations of dopant applied corresponds to V contents less than 0.05 % in the catalyst. As can be seen, the catalyst is effective even when the content of the rare earth vanadate is close to zero.

10. I attest that the catalyst examples based on REVanadates (e.g., Table 2b of the application) prepared according to the claimed process of claims 21 and 23 of the present application show good efficiency and high activity, even after exposure to elevated temperatures that would sinter and/or melt catalysts having V2O5.

11. I attest that Comparative Example 2 of Appendix C demonstrates that the technical effect of the invention (e.g., thermal stability of the catalyst) is effectively associated with the presence of rare earth vanadate (e.g., REVO4). Catalysts doped with transition metal based vanadates do lose significant activity after ageing. In contrast, catalysts doped with rare earth vanadates do show an increase of catalytic activity after ageing at 700°C/10 hrs and even more pronounced at 750°C/10 hrs. Such a result is surprising and unexpected.

12. I attest that Comparative Example 3 of the Experimental Report is submitted to demonstrate that no rare earth vanadates are produced in the process disclosed in US 4,466,947 (cited in the International Search Report). Therefore, the claimed invention is novel and inventive.

13. I declare further that all statements made herein of our own knowledge are true and that all statements are made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful, false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful, false statements may jeopardize the validity of the application or any patent issuing thereon.

Signed this 6<sup>th</sup> day of November, 2009.

  
Dr. Karl Scherzmann

**APPENDIX A**

**CURRICULUM VITAE**

**Personal data:**

Name: Karl Schermanz  
Born: September 30, 1954 in Klagenfurt, Austria  
Nationality: Austrian  
Marital status: Married

**Education and academic degrees:**

- 1972 (23.06.) **Abitur (Matura) 2.** Bundesgymnasium, Klagenfurt, Austria  
1979 **Magister Pharmaciae** (Mag. pharm.), University of Graz, Austria  
1983 **Doctor rerum naturalium (Dr. rer. nat.)** in pharmaceutical chemistry,  
University of Graz (with distinction "summa cum laude")

**Training courses with relevance to automotive exhaust gas after treatment:**

**4. FAD Conference, Dresden 2006**  
**SCR-System, Car Training Institute, Forum 9 – 10 May 2007, Stuttgart (Germany)**  
**SCR-System, Seminar 8 – 10 April 2008, Bonn (Germany)**

**Regular academic positions:**

- 01.01.1980 - 31.12.1983 Scientific Assistant, Institute of Pharmaceutical Chemistry,  
University of Graz (chair Prof. Dr. G. Zigeuner)  
01.01.1984 - 30.09.1989 Research Chemist at chemical company "CHEMIE LINZ  
AG", Linz, Austria  
**Since 01.10.1989 Employee of Treibacher Industrie AG and in its  
subsidiary "Treibacher Auermet "in different positions:**  
1989 - 1990 Head of R&D department "Chemical process development"  
1991 -1994/6 Head of R&D department „Rare Earth Chemistry“

1994/7 – 1996	Plant Manager of „Rare Earth“ in Treibacher Auernmet
1997 – 2002/6	Head of R&D in Treibacher Auernmet
Since 2002/7	Head of R&D department “Rare Earth Chemistry” in Treibacher Industrie AG

### Research experience:

- Organic chemistry:  
Synthesis of active ingredients applicable as pharmaceuticals and phytopharmaceuticals (at University Graz and Chemie Linz)
- **Inorganic Chemistry with emphasize on Rare Earths:**  
Synthesis of mainly functional materials based on Rare Earths and Vanadium for application in the fields of catalysis, glass and ceramics, pharmaceuticals.

### Overview on Publications

#### Organic Chemistry

More than 30 patents, patent applications and scientific papers in synthesis of organic materials (out of work at University Graz and Chemie Linz)

#### Inorganic Chemistry

Several patents and patent applications in fields of Rare Earths

#### Publications with relevance to Rare Earths and Catalyst Applications:

##### Articles, Scientific Books:

##### Seltene Erden (Rare Earths)

## APPENDIX B

### The influence of Tungsten on SCR activity in a TiO<sub>2</sub>-Rare Earth-V- System

I, Prof. Alessandro Trovarelli, one of the inventors of WO 2005/046864, declare that I have undertaken the following experiments showing the significant influence of tungsten in the TiO<sub>2</sub>-RE-Vanadate system on NO<sub>x</sub> conversion. For this there were compared 2 tungsten free and 2 tungsten containing materials based on TiO<sub>2</sub>-RE-Vanadates (RE being Er and Tb).

#### A) Preparation of the Tungsten free materials:

##### Preparation of TiO<sub>2</sub>/ 8.41 % ErVO<sub>4</sub>

104.6 mg of ammonium metavanadate were dissolved in 15 ml of oxalic acid 1N. The solution was heated in order to obtain the blue complex  $(\text{NH}_4)_2[\text{VO}(\text{C}_2\text{O}_4)_2]$  and then 3717.17 mg of Er-acetate solution were added. Moreover, some drops of HNO<sub>3</sub> were added in order to avoid the precipitation of the terbium oxalate. Then, the support [2747.7 mg of TiO<sub>2</sub> (DT 51)] was added. This slurry was brought to dryness under continuous stirring at 80-100°C. Finally, the solid was dried at 120°C overnight and calcined at 650°C for 2 hours, pressed into pellets, crushed and sieved in the range 355-425 µm. Ageing of the sample was carried out in a tubular furnace at a temperature of 750°C for 10 h under air.

##### Preparation of TiO<sub>2</sub>/ 8.41 % TbVO<sub>4</sub>

107.7 mg of ammonium metavanadate were dissolved in 15 ml of oxalic acid 1N. The solution was heated in order to obtain the blue complex  $(\text{NH}_4)_2[\text{VO}(\text{C}_2\text{O}_4)_2]$  and then 417.3 mg of Tb(NO<sub>3</sub>)<sub>3</sub>·6H<sub>2</sub>O were added. Moreover, some drops of HNO<sub>3</sub> were added in order to avoid the precipitation of the terbium oxalate. Then, the support [2747.7 mg of TiO<sub>2</sub> (DT 51)] was added. This slurry was brought to dryness under continuous stirring at 80-100°C. Finally, the solid was dried at 120°C overnight and calcined at 650°C for 2 hours, pressed into pellets, crushed and sieved in the range 355-425 µm. Ageing of the sample was carried out in a tubular furnace at a temperature of 750°C for 10 h under air.

#### B) Preparation of Tungsten containing materials:

##### Preparation of TiO<sub>2</sub>/WO<sub>3</sub>/ 8.41% ErVO<sub>4</sub> (corresponds to 5 % Er and 1.5 % V)

This material was prepared according to example 17 of WO 05/046864.

##### Preparation of TiO<sub>2</sub>/ 8.41 % TbVO<sub>4</sub>

This material was prepared according to example 18 of WO 05/046864.

Catalyst testing was carried out in the apparatus described in WO 05/046864. The gas feed consisted of  $\text{NH}_3/\text{N}_2$ ,  $\text{NO}/\text{N}_2$ ,  $\text{O}_2$ ,  $\text{N}_2$ . Mass flow meters were used to measure and control the single gaseous stream while an injection pump was used to introduce water. The feed stream was preheated and premixed and ammonia was added to the gaseous mixture immediately before entering the reactor to avoid side reactions. A tubular quartz reactor was employed inserted in a furnace. Temperature was controlled by a thermocouple inserted in the catalyst bed. The gas exiting the reactor was scrubbed with an aqueous solution of phosphoric acid to trap unconverted ammonia and then cooled to condense water vapor. Activity of the catalysts were measured under stationary conditions in a temperature range of 250°C to 450°C. Unless otherwise reported the standard gas composition and reaction conditions given in Table 1 were used. Conditions were selected in order to have a conversion not exceeding ca. 90% with reference catalyst. Gas composition analysis was carried out with an FTIR spectrometer equipped with a gas cell.

**Results and conclusion:**

The tungsten free catalysts show significant lower activity and particularly a drop in catalytic activity after thermal treatments, in contrast to what was found for the  $\text{WO}_3$  containing materials (compare examples 17, 17a and 18, 18a in table 2 and Table 3).

These results clearly show that  $\text{WO}_3$  plays a significant role in increasing the activity and thermal stability of these catalysts.

*Table 1: Reaction conditions and gas composition.*

Catalyst weight	100.0 mg
Particle size	350-425 $\mu\text{m}$

### APPENDIX C

#### EXPERIMENTAL REPORT

##### Comparative Example 1

**Determination of catalytic activity of TiO<sub>2</sub>/WO<sub>3</sub>/SiO<sub>2</sub> doped with low concentrations of ErVO<sub>4</sub> (after heat treatment 750°C/10 hrs).**

Preparation of the catalyst:

2 Catalysts (A and B) were prepared according to the description disclosed under 1.4.2. in WO 2005/046864 using TiO<sub>2</sub>/WO<sub>3</sub>/SiO<sub>2</sub> as a support material by introducing different amounts of ErVO<sub>4</sub> as a dopant.

The amounts of ErVO<sub>4</sub>, Er and V in the prepared catalyst are listed in table 1.

The catalytic activity of the samples was measured after applying ageing procedure (750°C/ 10 hrs) according to the test disclosed under 3. in WO 2005/046864, results shown in table 2.

Table 1 (Amounts of dopant in catalyst)

Catalyst	ErVO <sub>4</sub> [%]	Er [%]	V [%]
A	0,84	0,50	0,15
B	0,2	0,12	0,03

Table 2, Catalytic activity (NO conversion in %) at different temp. of aged catalysts (750°C/ 10 hrs)

Catalyst	NO conversion in % at 250°	NO conversion in % at 320°	NO conversion in % at 450°
A	29	66	52
B	7	58	42

#### **Conclusion:**

Even very low concentrations of ErVO<sub>4</sub> present as a dopant do show a catalytic effect ! The concentrations of dopant applied corresponds to V contents less than 0,05 % in the catalyst.

## Comparative Example 2

Comparison of Catalytic Activity of "Rare Earth Vanadate" containing catalyst versus  
"Transition Metal Vanadate" containing Catalyst

Objective: Proof on effect of Rare Earths contributing to thermal stability of catalyst in the  
TiO<sub>2</sub>/WO<sub>3</sub>/SiO<sub>2</sub> system.

For the experiments 3 different types of dopants were used to show the effect of Rare earths on  
activity of the catalyst after ageing. All the 3 dopants themselves are thermally stable up to temp.  
> 800°C

Dopants used for making the catalyst:

- a) ErVO<sub>4</sub> (Rare Earth Vanadate)
- b) FeVO<sub>4</sub> (Transition Metal Vanadate)
- c) MnV<sub>2</sub>O<sub>7</sub> (Transition Metal Vanadate)

### 2.1. Preparation of ErVO<sub>4</sub> and Transition Metal Vanadates

#### 2.1.1. Preparation of ErVO<sub>4</sub>

ErVO<sub>4</sub> was prepared according to the description disclosed in WO2005/46864 under 1.4.1.

#### 2.1.2. Preparation of Fe-Vanadate

119,7 g Fe(III)(NO<sub>3</sub>)<sub>3</sub> x 9 H<sub>2</sub>O (Fe<sub>2</sub>O<sub>3</sub> content = 19,5 %) was dissolved in approx. 320 ml  
water to yield a solution. On the other hand 34,3 g ammonium metavanadate (V<sub>2</sub>O<sub>5</sub> content =  
77,6 %) was dissolved in approx. 1100 ml water at approx. 80°C. After mixing the solutions  
under continuous stirring the pH was adjusted to 7,25 by adding 24% ammonia solution. The  
slurry with precipitate so formed was stirred for ½ hr, filtered, the precipitate washed several  
times with deionised water and dried at 120°C to yield Fe-Vanadate (FeVO<sub>4</sub>), structure proved  
by elemental analysis and XRD spectra.

For FeVO<sub>4</sub> there is reported a melting point of 880°C by SHUBHA GUPTA et al. in J. of  
Material Sciences Letters, Vol 5, number 5, July 1986

#### 2.1.3. Preparation of Mn-Vanadate

Mn-Vanadate was prepared according to the description disclosed under 2.1.1 using 66,4 g of  
Mn(II)(NO<sub>3</sub>)<sub>2</sub> \* 6 H<sub>2</sub>O (MnO<sub>2</sub> content = 34,6 %) and 34,3 g ammonium metavanadate (V<sub>2</sub>O<sub>5</sub>  
content = 77,6 %). After filtration, washing and drying of the precipitate there was yielded Mn-  
Vanadate (structure according to XRD being Mn<sub>2</sub>V<sub>2</sub>O<sub>7</sub>).

Remark: Since Mn is present as an (+2) Ion in the starting material Mn(NO<sub>3</sub>)<sub>2</sub> a formula of  
MnVO<sub>4</sub> cannot exist. The synthesized Mn-Vanadate corresponds therefore to the structure

Mn<sub>2</sub>V<sub>2</sub>O<sub>7</sub> as proved by XRD. However, oxidation stage of Vanadium in the compound is +5 (like in Rare Earth Vanadates (REVO<sub>4</sub>) and in FeVO<sub>4</sub>).

For Mn<sub>2</sub>V<sub>2</sub>O<sub>7</sub> there is reported a melting point of 820°C by Park et al. in US Patent 6 777 363.

## 2.2. Preparation of the catalysts and measurement of catalytic activity.

3 Catalysts (A -C) were prepared according to the description disclosed under 1.4.2. in WO 2005/046864 using TiO<sub>2</sub>/WO<sub>3</sub>/SiO<sub>2</sub> as a support material by introducing the dopants ErVO<sub>4</sub> (Catalyst A), FeVO<sub>4</sub> (Catalyst B) and Mn<sub>2</sub>V<sub>2</sub>O<sub>7</sub> (Catalyst C).

Thus 252,3 mg of the "Metal Vanadate"(Er, Fe and Mn) and 2747,7 mg of the TiO<sub>2</sub>/WO<sub>3</sub>/SiO<sub>2</sub> support material were used for preparing the catalyst.  
Ageing of the catalyst was performed at 700°C/10 hrs and 750°C/ 10 hrs respectively.

The catalytic activity of the "fresh" and "aged" samples were measured according to the test disclosed under 3. in WO 2005/046864, results shown in table 3.

Table 3

Sample	Dopant	Ageing conditions [°C/hrs]	% NO conversion at 250°C	% NO conversion at 270°C	% NO conversion at 300°C	% NO conversion at 320°C	% NO conversion at 450°C
Example 18, WO 2005/046864	ErVO <sub>4</sub>	Fresh	33	na	na	75	64
		750 / 10	73			91	46
Catalyst A	ErVO <sub>4</sub>	Fresh	25	na	70	na	na
		700 / 10	56	70	82		
Catalyst B	FeVO <sub>4</sub>	Fresh	72	88	93	na	na
		700 / 10	19	28	39		
Catalyst C	Mn <sub>2</sub> V <sub>2</sub> O <sub>7</sub>	Fresh	27	42	60	na	na
		700 / 10	1	2	2		
		750 / 10	0	na	na	0	0

## Conclusion:

The examples clearly demonstrate the contribution of Rare Earths to the thermal stability of the catalyst. Catalysts doped with transition Metal based Vanadates do loose significantly their activity after ageing; in contrast catalysts doped with Rare Earth Vanadates do show an increase of catalytic activity after ageing at 700°C/10 hrs and even more pronounced at 750°C/10 hrs.

### Comparative Example 3

#### **No Formation of Rare Earth Vanadates in view of D5 (US 4 466 947)**

To proof about non formation of RE-Vanadate in an example which was made according to example 1 disclosed in US 4 466 947.

There was made an experiment using the basics of example 1 of US 4 466 947 additionally introducing  $\text{Er}_2\text{O}_3$  into the system.

Thus 25,3 g of Titanic Acid (containing 87,2 %  $\text{TiO}_2$ ) where suspended in approx. 100 ml of water yielding a suspension with a pH value of 4,9. The suspension was neutralized with aqueous ammonia to reach a pH of 7,02. 1,55 g Erbiumoxide ( $\text{Er}_2\text{O}_3$ ) was added under stirring to the suspension.

1,86 g Ammoniumparatungstate (containing 88,7 %  $\text{WO}_3$ ) was dissolved in approx. 50 ml of hot water and the solution added to the Ti/Er-mixture. The water was evaporated until the material could be pressed. A tablet (diameter approx. 2,5 cm) was formed by using a press.

The tablet was dried at 80°C for 12hrs and calcined at 500°C for 5 hrs. Afterwards the tablet was dipped into a bath of monoethanolamine and dried. Finally the tablet was dipped into a solution of Vanadyl oxalate containing 4,2 % of  $\text{V}_2\text{O}_5$  dried and calcined at 750°C for 10 hrs. After calcination the sample was crushed and the resulting powder subjected to XRD analysis. No peaks for  $\text{ErVO}_4$  could be detected in the XRD spectra of the sample.

#### Attachments:
